

## POWER QUERY AS EXCEL'S ETL – DEMO NOTES

- I want to “pivot” on the file wholesale\_customers.xlsx. What is the problem? .
  - o There is no “sales” field to “pivot” on. I have several fields representing one attribute, category.

The screenshot shows an Excel spreadsheet with a PivotTable. The PivotTable is located in columns A and B, with rows 1 to 37. The PivotTable has 'Row Labels' in column A, with values 1, 2, and Grand Total. The PivotTable Fields task pane is open, showing a list of fields: Channel, Region, Fresh, Milk, Grocery, Frozen, Detergents\_Paper, and Delicassen. The 'Channel' field is selected and placed in the 'Rows' area. The 'Update' button is visible at the bottom right of the task pane.

- How would we have fixed this in Excel without Power Query
- What does this example tell us about how data should be shaped?
